

SQL \Rightarrow Structured Query Language

Data Modeling

Data Modeling is a critical step in defining data structure, creating data models to describe associations and constraints for reuse. Data model is the conceptual design or plan for organizing data. It visually represents data with diagrams, symbols, or text to visualize relationships.

Data Modeling Terminology

① Entity \Rightarrow Entity are object or items in business environment for which we need to store the data.

ex- In ecommerce data entities are People, Customers, order, product.

② Attributes \Rightarrow It provide a way to structure and organise the data within an entity.

ex \Rightarrow Name, Address, EmailID, Contact details.

\Rightarrow Sale, OrderID, OrderDate, Ship day

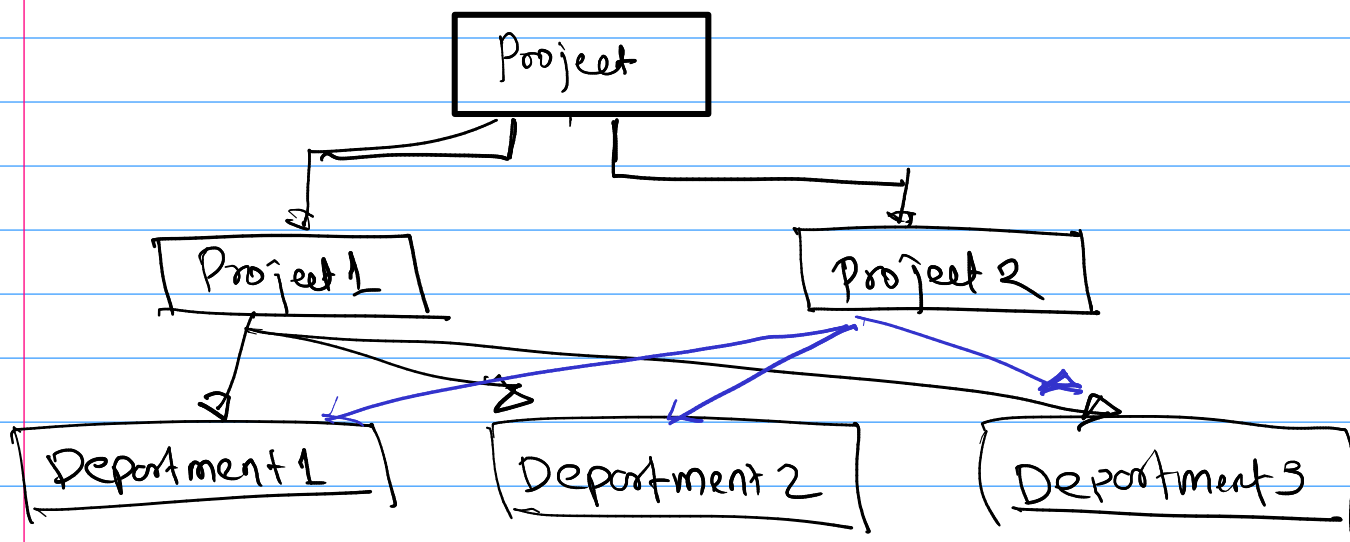

③ Relationship :- \rightarrow How entities are connected with each other .

④ Reference Table :- \rightarrow It is used to resolve relationship between entities.

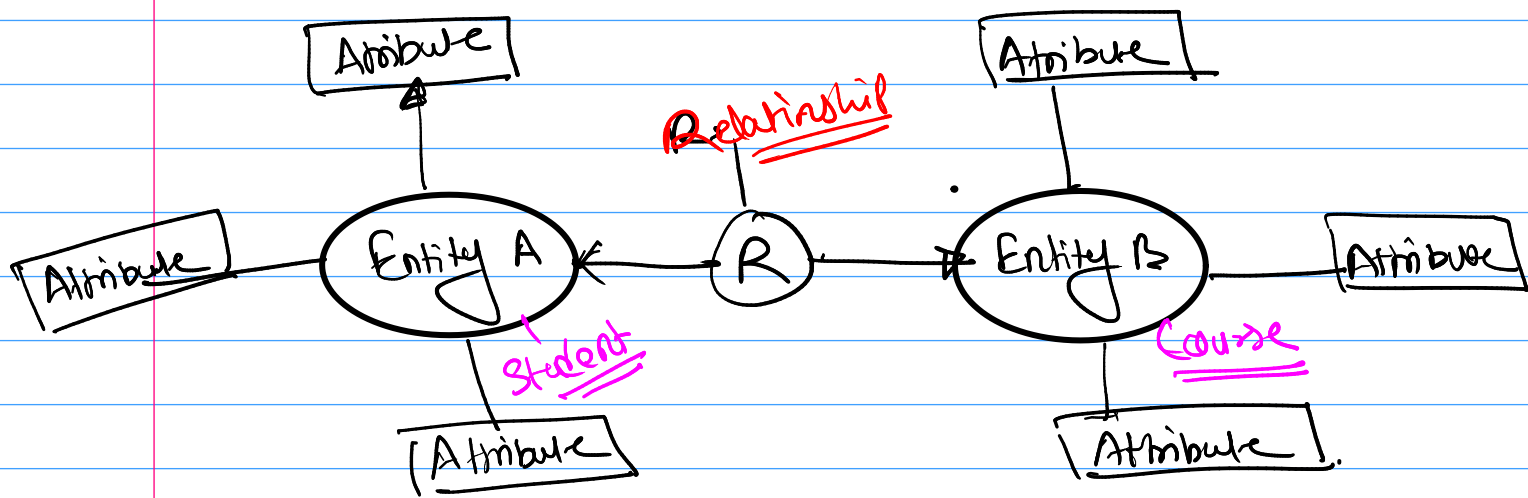

⑤ Schema :- \rightarrow It refers to Complete description or blueprint of the data base.

⑥ Database :- \rightarrow The storage space to store the entities.

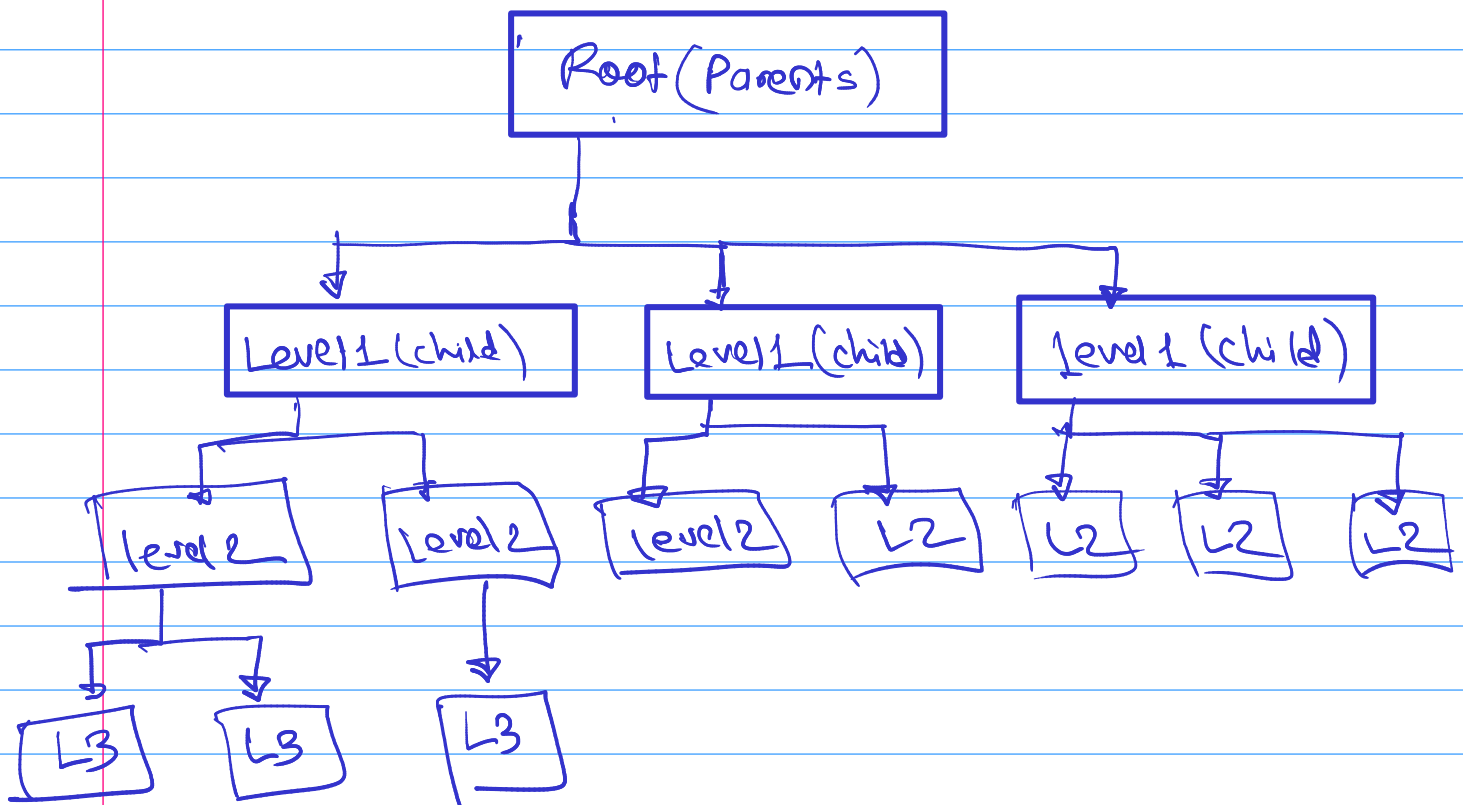

⑦ Network Model.

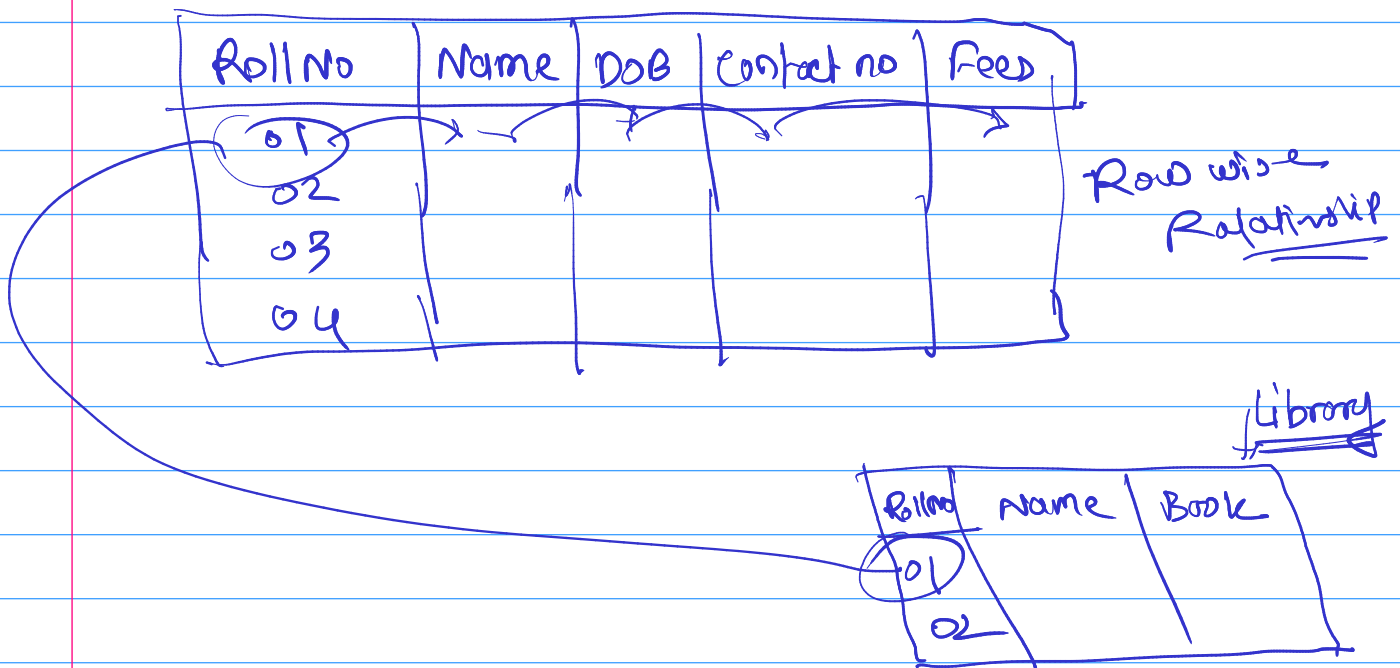

② ER-Model → Entity Relationship Model.

③ Hierarchical Model :-

④ Relationship Model

What is Database?

A database is like a digital warehouse where data is stored, organized, and managed efficiently. Database is a physical or digital storage system that implements a specific data model. Database is the actual implementation of that design, where the data is stored and managed.

Data :-> Fact, piece of Information store in the table or entity.

Queries :->

Queries are like search commands that allow users to extract specific data from the database. Users can search, filter, and sort data based on the criteria they specify. For example, a query can be used to find all customers who made a purchase in the last month.

① RDBMS \rightarrow Relational Data Base Management System.

\hookrightarrow Relational Database Operated data into rows & Columns and Table. & Tables relationship depends on keys.

- SQL - Structured Query Language.

- Oracle

- Microsoft SQL.

MySQL -

② NO SQL Database \rightarrow No relational database

does not have rows & Columns. not using fix schema model.

= MongoDB, Cassandra,

= Couchbase.

③ Object Oriented Database \rightarrow Store data in object form.

\hookrightarrow ObjectDB, db4o

④ Time Series Database \rightarrow

Share market

\hookrightarrow InfluxDB
